Crushing Production Milestones

Q3 EDITION 2026

Eco-Match recently hit the 300,000-ton milestone at OYA Wind Farm!

An excellent achievement for Eco-Match as we celebrate reaching the 300,000-ton aggregate production milestone on site. This is a fantastic reflection of consistent production, teamwork and commitment to delivering for our client.

Well done to the entire team, expertly managed by Kobus van Schalkwyk, for reaching this impressive milestone and keeping production on track.

Creamer Media's Mining Weekly Feature

We're proud to share that Eco-Match has once again been featured in Creamer Media's Mining Weekly.

The latest feature, "Mobile crushing and screening reduces emissions", explores how processing suitable raw material on or near project sites can reduce the need for long-distance aggregate haulage — helping to reduce truck movements, material handling, logistical requirements and associated project emissions.

The article also highlights the growing relevance of mobile crushing and screening on large-scale renewable-energy projects, where construction activities can span extensive

"It provides flexibility for clients, as the crushing and screening train can move around the typically large project areas as construction progresses, producing aggregate material exactly where and when it is needed."

and remote areas. Mobile processing provides the flexibility to produce aggregate closer to where it is required as construction progresses. For us, the message goes beyond simply moving a crusher to site. The right material, the right specification and the right processing solution all need to work together.

We're pleased to have Eco-Match's experience in this space recognised once again.
